

Closed-loop digital meditation for neuro-cognitive and behavioral development in adolescents with childhood neglect

Supplemental Information

Supplementary Figure S1. Sample size by power plot. Calculations are for a repeated measures analysis of variance for detecting a large effect size ($\eta^2 \geq 0.14^{56}$) between-group effect compared for three intervention groups (IAI, EAI, NI) with two repeated measures (baseline vs. post-intervention). The red intersecting lines show that a sample size of 45 is powered at >0.8 with alpha level of 0.05.
